342 /14 cont./
592 Under these windscreens the families live, one beside the other. The space for each family amounts to three to four meters. In the center burns the fire, which is kept going day and night.
354 To the right and left of it hangs a hammock each for the man
352 and the woman (Ill. 29). In the case of larger families, the
592 hammocks are hung around the fire in a triangle and, if neces-
342 sary, one above the other. In the latter case, the chief wife always sleeps below and the man above, while the second wife and the older children, or the grandmother, lie in the hammocks
● 353 on the opposite side of the fire. Above and behind the hammocks
342 the implements, bows, arrows, quivers, knives, baskets etc., are hung on the roof framework. In addition, most families
231 have a square or rectangular wooden framework set up far in the
342 background, which is about one meter high, one-half to at most one meter long, and is provided with side walls 30 to 50 centimeters high, in which the young dogs sleep, the so-called
[174] dog-bed (Ill. 30). Whether this arrangement is indigenous or was taken over from Karaiben /Carib/ tribes some time in the past could not as yet be determined. According to a statement
[171] by the German Franciscan monk, Protasius Frikel, of Santarem, similar dog-beds are also in use among the Karaiben tribes on the Rio Trombetas (53).

53. Personal statement by P. Frikel on the occasion of the XXXI. Int. Amerik. Kongr. in São Paulo, 1954.

342 The chief's hut obviously owes its origin to the model of the
622 huts of the planters, and rubber and palm-fiber gatherers. It
[179] has a rectangular ground plan, the broad side is turned toward the courtyard, and it is also open on this side. The length is 9.70 meters, the width six meters, and the height, exactly the same as the windscreens, about six meters. In the center stand four posts five meters long, at both the front and back four smaller ones, each of which is 2.55 meters high. The small

/14 cont./

342 622 posts are joined by crossbeams; in addition, horizontal strips lead to the tall posts, whereby a gable roof is formed. Over this again lie small, thin cross-strips, on which, exactly as in the case of the large windscreens, the panos, the rectangular palm-leaf mats, are fastened. In the same manner, the rear wall and the two side-walls are also provided with panos. Between the two ends of the front side there are fastened three poles half a meter high, which are often used as sitting places. The entrance, which is one meter wide, is on the right-hand narrow side. The fire burns in the center of the hut, and in a triangle around it are fastened the hammocks in which the chief, his two wives, and the children sleep. All the implements hang on the crossbeams and on the plaiting of the rear wall.

[354] [352] [353]

343 To the right, next to the chief's house, stands a small, open hut which is four meters long, two meters wide, and six meters high. Here, too, the roof has a gable-shape and is likewise covered with panos made of ubim leaves. Under the roof is found a latticework pen about 1.60 X 2 meters, which is used as a rooster coop.

342 From an architectural standpoint, this open, almost circular construction, in which, to be sure, the chief's hut and the coop for the roosters form two foreign bodies added later -- represents an unexcelled method of building, particularly for this hot, tropical region. The circular shape prevents the wind from entering, and the rain, too, cannot reach the families living in the dead angle under the roofs. Moreover, there is always pleasantly fresh air, so that even upon leaving this maloka there is no danger of catching cold. Tribes or groups living in closed malokas are much more subject to respiratory ailments when they leave the warm community house and step out into the cool morning or night air. This maloka of the Surára may doubtless be regarded as one of the oldest and most primitive types of construction of the South American Indians. Around the community house, plantings have been laid out (Ill. 37) and at the present time extend to the middle of the mountain slopes.

342 The two windscreens had two posts stuck superficially into the ground at a distance of two meters apart. Contiguous to the post there was a smaller stake tied to it with a bejuco. The roof of this screen was covered with interlaced branches and roofed with platanillo leaves and supported with a slight inclination against two posts. The roof projects from the posts some [352] 40 centimeters and touches the ground at its lower edge. In these houses the Sanemá hang their hammocks of bejuco or majagua. In some ranchos we found vestiges of fire.

177 The houses of Makiritare type (rectangular or oblong) are 342 small-scale imitations and have only one room. The roofs, made of palm leaves, are of two rectangular slopes and are raised on four or six posts. The edges of the roof are straight or rounded. The walls consist of bark or juxtaposed sticks. They have an average dimension of four meters long by two meters wide and approximately three high. Each house has one or two 353 quite narrow doors. Within the house (of the Makiritare type) [179] the greatest disorder reigns: from the roof and from the walls hang baskets, gourds, weapons, leather bags, tobacco, palm fruit, hammocks /chinchorros/ of bejuco, majagua, and cotton. On the floor there are hearths, firewood, cooking utensils, guapas with spindle and cotton, yuca graters, dogs, and children, all in confusion without order or arrangement. It is clear that they are not used to living under a roof, and the house is a place for storing things rather than a habitation.

105 The technology of the Sanemá is very little-developed, and 422 precisely for this reason one can classify the Sanemá (and 484 the Yanoama in general) as representatives of the most backward peoples of America and of the whole world. It would seem that the ideal of these seminomadic Indians is: omnia mea mecum porto -- everything that is mine I carry with me! and, apart from their weapons, a few implements, and a basket, it is unusual [352] for them to carry anything else on their travels. They do not even transport their hammocks /202/ of bejuco or majagua from one camp to another, but rather make new ones each time they need them.

Barker told us that it was no more than a temporary stopping-place on one of the jungle trails, no family ever remaining for more than a week. And so we found on our various return visits. The inhabitants were always different and their numbers varied considerably. Barker could not tell us how frequently these villages occur in the forests. He said he had been to only one other during his seven months' stay.

Every home possesses two or three calabashes, gourds and baskets, all dyed with ochre and some decorated with macaw or toucan feathers. All such objects of daily use have loops of string tied to them by which they can be hung from the hut's roof. Each family also has its little knives of capybara teeth. Firesticks are kept carefully packed away to keep them dry during disuse, as fire is always available from glowing embers that are never allowed to go out. We saw a number of baskets which women carry on their backs, but could not discover what they were used to carry—probably household utensils in the course of their journeyings. I could find no Waïka musical instrument, but in one hut, the only one with no hammock in it, I came across a sort of fibre cape hanging from a beam. As this was the only garment of any sort that I saw, it may well have been a ritual robe.

In every house there was at least one fire, and joints of unskinned peccary and branches of green bananas hung from many rafters. In an unornamented earthenware jar shaped like a bell we saw a peccary's head boiling whole with all its hair and skin. In another hut a child was eating a small alligator which had been grilled on the embers.

The Waïkas do not know salt and spat out the little we gave them in disgust. We thought that perhaps the huge quid of tobacco which the men, women and children keep under their lower lips might perhaps compensate for this deficiency. As with the Guaharibos, the women make up the quids every morning, impregnating them with their own saliva before passing them on to their mates.

Barker said he had never known Waïkas to build or use any sort of river-craft—not even a raft. He told us that the
